RE: OROGO Final Operations Report – Cameron J-37 – OA-2018-003-SOG

As you are aware, on January 28, 2020 (the “**Receivership Date**”), the Court of Queen’s Bench of Alberta (the “**Court**”) granted an Order pursuant to section 243 of the Bankruptcy and Insolvency Act, RSC 1985, c. B-3 and section 13(2) of the Judicature Act, RSA 2000, c. J-2, whereby Alvarez and Marsal Canada Inc. (the “**NWT Receiver**”) was appointed Receiver, without security, of all of the current and future assets, undertakings and properties of Strategic Oil and Gas Ltd. and Strategic Transmission Ltd. (collectively, “**Strategic**” or the “**Company**”) situated in the Northwest Territories (the “**NWT Property**”). For further information on the Receivership proceedings, please visit the NWT Receiver’s website at: www.alvarezandmarsal.com/sog.

The NWT Receiver, the Government of the Northwest Territories and ELM Inc. (“**ELM**”) entered into an abandonment agreement for the purposes of completing the abandonment work required by the office of the Regulator of Oil and Gas Operations (“**OROGO**”).

The NWT Receiver respectfully endorses the submission made by ELM to OROGO for the purposes of this final operations report.

Should you have any questions or require further information, please contact the undersigned at dmacrae@alvarezandmarsal.com.

Yours truly,

**Alvarez & Marsal Canada Inc., in its capacity as Receiver of
Strategic Oil & Gas Ltd. and Strategic Transmission Ltd.’s NWT Properties
and not in its personal or corporate capacity**

cc: Christopher Gagnon Christopher@elminc.ca

Encl.

RE: Final Operations Report – Cameron J-37 (ACW-2021-SOG-J-37-WID 1751)

ELM Inc, acting on behalf of Alvarez & Marsal Canada Inc in their capacity as the receiver for Strategic Oil and Gas Ltd submits the following documents as part of the final reporting for this well.

1. Well Termination Record
2. Morning Reports
3. Final well schematic
4. Photographs from cut and cap operation.
5. Perforating logs (Sent as a separate email attachment)

The change of well status form will be sent as a separate attachment.

Should you have any questions or require further information, please contact the undersigned at
christopher@elminc.ca

Sincerely,

Christopher Gagnon, EIT

ELM Inc, acting as a consultant to Alvarez & Marsal Canada Inc

WELL TERMINATION RECORD

INSTRUCTIONS:

1. Complete both pages.
2. Send one electronic copy of this form and supporting technical documentation by email to orogo@gov.nt.ca. If you wish to communicate with OROGO in hard copy, please do so using the courier address found at www.orogo.gov.nt.ca.

WELL INFORMATION

Well Name	Strategic et al Cameron J-37	Operator	Strategic Oil & Gas Ltd
Well Type	Exploratory Well (if Other, specify _____)	Contractor	Elm Inc
Well Identifier	1751	Current Well Status	Abandoned

RELATED LICENCES AND AUTHORIZATIONS

Operating Licence No.	<u>NWT-OL-2014-007</u>	Operations Authorization	OA - 2018-003-SOG
PRA Licence No.	<u>Production Licence 14</u>	Approval to Alter Condition of Well	ACW - 2021-J-37-WID 1751

LOCATION INFORMATION

Coordinates Datum: NAD27 (if Other, please specify _____)

Surface	Lat 60° 6' 35"	Long 117° 36' 26"
Bottom Hole	Lat 60° 6' 35"	Long 117° 36' 26"

Region: South Slope Unit J Section 37 Grid 60-10N 117-30W

ACTIVITY INFORMATION

Target Formation(s)	Keg River / Sulphur PT	Field/Pool(s)	Cameron Hills /
Elevation KB/RT	729.4 m	Ground Level / Seafloor	725.7 m
Spud/Re-entry Date	8 days	Total Depth	1576 m KB
Rig Release Date	January 23, 2023	Total Vertical Depth	1576 m KB

CASING AND CEMENTING PROGRAM

O.D. (mm)	Weight (kg/m)	Grade	Setting Depth (m KB)	Cementing (m ³)	
244.5	53.57	J-55	393	22.8	
177.8	29.76	J-55	1252.0	35.96	
114.3	14.14	J-55	1137.6 - 1575.0	11.93	

PLUGGING PROGRAM				
Type of Plug	Interval (m KB)	Felt	Setting Depth (m KB)	Cementing (m ³)
Bridge	1323-1382	No	1382	0.5
Bridge	1101.4-1125	No	1125	0.5
Cement Retainer	441.1-460	No	460	13.8
Select	-	Select		

PERFORATION	
Interval (m KB)	Comments
1393.0-1403.0	Sulphur Point - Abandoned
470.0-471.0	Remedial Perforation - Circulated 13 m ³ of cement through perforations
-	
-	

OTHER	
Lost Circulation/Overpressure Zones	
Equipment Left on Site (Describe)	None
Provision for Re-entry (Describe and attach sketch)	Vented cap 2.1 meters below ground level
Other Downhole Completion/Suspension	Keg river was previously abandoned by operator, refer to schematic. Abandonment of liner top @ 1137.6 mKB with plug and cement.
Additional Comments	

"I certify that the information provided on this form is true and correct"

Name	Duncan MacRae	Phone	(403)538-7514Ext
Title	Vice President	E-Mail	dmacrae@alvarezandmarsal.com
Operator	Alvarez & Marsal Canada Inc., in its capacity as receiver of Strategic Oil & Gas's NWT Property		
Signature	 Responsible Officer of Company	Date	April 5, 2023

		DAILY REPORT		
CLIENT:	Strategic Oil & Gas C/O Alvarez & Marsal		DATE:	January 16, 2023
UWI:	300/J-37 60-10N 117-30W		Report #:	1
PROJECT MANAGER:	Christopher Gagnon		AFE #:	
Proj # / AFE / Job Number:	STRA050	AFE Amount:	\$254,700.60	\$297,547.94
Project Descriptor:	Well Abandonments			
Cost Coding	Surface Location	60.109870, -117.608822	AREA	Cameron Hills NWT
	License	1751		

EXECUTIVE SUMMARY:

NWT App: ACW-2021-SOG-J-37-WID1751

Day 1: Move to location, Rig up, Install bop's move in slick like pull plug assembly from 60mKB and pull plug assembly from 1369mKB, SDFN

Day 2: Kill the well, Unset the packer, POOH with production string, RIH with Bridge plug, hang plug for the night.

Day 3: Spot 114.3mm BP at 1382mKB, Set and pressure test hole to 7 mPa. Batch up 0.5m³ og class G cement. Balance in place, POOH with tbg. Move in and rig up Wireline to run CBL. Send logs to elmdownhole winterize equipment, SDFN.

Day 4: Standby day

Day 5: Orientate the new rig crew, RIH with 177.8mm BP, set and pressure test. Orog visited and inspected equipment. Balance cement plug, Rig in wireline, Perf. 470 -471mKB, Break circulation up the surface casing.

Day 6: Circulate the surface casing clean, RIH and set retainer, Pressure test and wait on cementers. Cementing postponed for tomorrow. Circulate the remaining clean fresh around the well and SDFN.

Day 7: Cementers encountered road troubles and were late, rig in cementers Pump and circulate 13.8m³ slurry squeeze and obtained a 2mPa flat line. Back wash leaving 15m above retainer. Pooh with 5 joints, SDFN.

Day 8: POOH lay down tbg, Rig out equipment and move to next job. Well head riser, 147 jts of pipe, pup jts and piles remain on location. Well head painted orange ready for cut and cap.

Day 9: Move in and run in with CBL. Log the well. Rig out and move off.

Day 10: No bubbles on surface vent. Conduct cut and cap on well. Well cut 2.1 meters below existing ground level.

Time	Well Abandonments
07:00	Hold a pre job safety meeting and hazard assessment meeting. The topics discussed were Moving equipment to next location, Using safety glasses when hammering on unions. Spoke about calibrating the crown saver to make sure it will stop in the allotted time. Talked about the job scope for the day. moving, rigging up, installing BOP's pulling tbg plug unset setting packer and killing the well.
07:30	Conduct a walk around lease and equipment inspection. Hook up the trailers and start the move to location.
08:15	Arrive on location. Conduct a walk around lease inspection. Found piles scattered throughout the lease. Maneuver around the pilings with the equipment. Conduct an LEL sweep of the wellhead area. negative tests.
09:00	Check pressures on the well. SITP 28kPa, SICP 17kPa. Conduct a bubble test by attaching a 13mm clear hose about 30cm long to the surface casing vent assembly. Submerge the hose into 25mm of washer fluid and monitor for 10 minutes. No bubbles. Continue to monitor the vent while working around the well.
10:30	Rig up the service rig, Pump and tank, Pressure vessel and flair stack, accumulator shack, boiler and flameless heater. Function test the BOP's, starting pressure 20,500kPa and final pressure after 3 functions was 15,000kPa. Change the pipe rams over to 73mm Rig in pump line to pressure test the pipe rams, blind rams, working spool valve, stabbing valve to 1.4mPa and 21mPa for 5 minutes on each stage. Bleed the pressure off.
12:30	Remove the well head and install the landing joint and stabbing valve into the 73mm eue lift threads on tbg hanger. Install the BOP's Rig in the pump lines to pressure test the annular preventer (bag) and R-45 ring seal to 1.4mPa and 7 mPa for 10 minutes on each stage. Held good.
14:00	Rig in the work floor and tbg handling equipment. Move in with slick line unit and crew.
14:15	Hold a pre job safety meeting and hazard assessment meeting, The topics discussed were applying pressure before unsetting the tbg plug. Working with slick line unit, staying off the rig floor, Unsetting the packer before retrieving the tubing plug.
14:30	Rig in the slick line unit. Make up equalizing prob. Rig in the pump line to the flow T. Fill tbg with 0.1m ³ of fresh water and apply 3500kPa pressure. Tag and prob the tubing plug at 60mKB. POOH remove the prob, Make up and RIH with Pulling tool, RIH and pull slip stop, POOH, RIH with puller and pull the tbg plug, Pulled and jarred on the plug numerous times to release the plug. Pull then was dragging up the hole for 2 meters before letting go. POOH and recovered the tbg plug, RIH to retrieve the collar stop. POOH and recovered the collar stop.
17:00	Make up and RIH in the retrieval tool and was only able to get to 96mKB, Work the line to try to get passed and we could only get to 101mKB, could not make any more hole. POOH and found a piece of fine spring tangled up in the pulling tool. Make up and RIH with cable grab tool and tagged at 101mKB, Work the cable grab tool up and down a few time and managed to break through the tight spot. Run the tool down to 115mKB with no issues, ran the tool up and down through the tight spot from 90m to 110 meters and was able to get through with no issues. POOH and there was nothing in the cable grab tool it was clean.
19:00	RIH with probe pulling tool. RIG and tagged the plug at 1369.5mKB. latched on and was able to pull the probe out of the plug. POOH and recovered the probe. Make up and run in the hole with the plug pulling tool. Was able to latch on and could not pull plug free, sheared off. with the shear up tool, Make up the shear down tool and latch onto the plug. Pull more weight into the plug and fire jars. Fired jars repeatedly and tried to shear off the tool by jarring down. While trying to shear off the plug let loose and pulled out of the hole with the lock assembly. Rig out slick line unit.
20:00	Secure and night cap the well, Drain and winterize the pump lines.
20:30	Debrief with the crew.

Time	Well Abandonments
07:00	Hold a pre job safety meeting and hazard assessment meeting the topics discussed were job scope for the day, unsetting the packer, Pulling out of the hole. Setting bridge plug, heads up on another man down drill coming up and doing pack drills to get better at dawning SCBA's
07:30	Conduct a walk around lease and equipment inspection, Function test the E-kills, Crown saver and BOP's SICP 0 kPa, SITP 1380kPa. Check the bubble tester for bubbles, No bubbles.
08:00	Rig the testers into the tubing to bleed off the gas head to the flair stack. bleed 1.13 e ³ m ³ , tubing lifted 0.3m ³ of produced fluid to the test vessel. Rig in the pump line and pump 10m ³ of 1% H ₂ S scavenged water down the tbg. Tubing on a slight vac.
09:00	Pick up on tbg string while holding 1 rotation of torque, Pulled 13daN (3daN over string) the anchor unset the the casing went on vac. Allow the packer elements to
10:00	contract for 15 minutes.
11:00	Rig in the pump line to pump 20m ³ of 1% H ₂ S scavenged fresh water down the casing. Casing on vac.
12:00	Start pulling out of the hole with the production string. While pulling driller noticed the well was venting slightly. Stop and tie in the pump line to trickle down the casing @ 150L/min (minimum pump rate) while pulling out of the hole.
13:00	Pulled out of the hole with the production string as follows; 1- 73mm tbg joint, 3- 73mm tubing pups, 145- 73mm tbg joints, 1- profile nipple, 1- 73mm x 114.3mm on/off tool, 1- 73mm handling pup, 1- 114.3mm double grip packer, 1- 60.3mm pup joint, 1- 60.3mm profile no-go nipple c/w re-entry guide. The last 42 joints were slim hole
14:00	collars and changed out tubing elevators to slip type elevators. Trickle 9.5m ³ of kill fluid down while pulling out of the hole.
15:00	Make up and Run in the hole with a 10k 114.3mm permanent drillable bridge plug on a HM setting tool, 1- handling pup, 1- 114.3mm mechanical casing collar locator, 1-
16:00	handling pup, Tubing to surface, Well was starting to vent again while tripping in the hole. Start the pump and trickle at 150L/min
17:00	Hang the bridge plug 22 meters short of set depth, haul tubing to location for morning. Trickle 7.5m ³ of kill fluid while tripping in the hole.
18:00	Drain and winterize the pump and lines. Secure and night cap the well head. fuel equipment
18:30	SDFN

Time	Well Abandonments
07:00	Hold a pre job safety meeting and hazard assessment meeting. The topics discussed were Radio controlled roads calling kms, Making up JSA's for jobs that are out of the ordinary submitting them to Orego for review before proceeding with the task.
07:30	Preformed a walk around lease and equipment inspection. Check the bubble tester for bubbles. No bubbles, Check the SICP 120kPa, SITP 0 kPa, Bleed the pressure off to the P-tank. No trace of H ₂ S. Function test the crown saver, E-kills and BOP's, Function test was 21,000kPa and final was 15,000kPa.
08:00	Pick up tbg and locate casing collars at 1363.9 & 1376 and 1388.2mKB. Spot the Permanent drillable bridge plug @ 1382mKB . Set Bridge plug by pumping 4m ³ of clean fresh water down the tbg to pressure up to 16mPa to activate the HM setting tool. Pick up and pack off the element by pulling 10 daN over string (19daN) Hold for a few minutes. Lower tbg string down and set string weight on the plug. Pick up 2 daN over string, Fill casing with 7.2m ³ of fresh water to pressure up the hole and pressure test to 7mPa for 10 minutes. Held solid. Bleed the pressure off to 0kPa. Rotate tbg to the right 6 rotations to release the setting tool from the bridge plug. Using the rig pump, suck back on the casing while batch mixing and pouring 0.5m ³ of class G slurry mixed at 1900kg/m down the tubing. Rig in the pump line to forward circulate 4m ³ to balance the cement on top of the bridge plug leaving cement top @ 1323mKB . pull 6 joints slowly through the cement.
10:00	Rig in pump lines to reverse circulate the well over to clean fresh water, Pumped 26m ³ @ 500L/min Stop the pump.
11:30	Pull and stand tubing in the derrick, With 5 joint left in the hole. Rig in the pump line to break forward circulation topping up the hole with 3m ³ fresh water. Continue pulling out of the hole.
15:00	Move in and rig up Wire line unit, RIH with HSOV CBL to 1200mKB. Log from 1200mKB to surface. Send the logs via email to elmdownhole for review.
17:00	Received instruction to run a pressure pass from 1200mKB to 325mKB. RIH to 1200mKB, Pressure up and maintain 5mPa on the casing while pulling the CBL. Send the results of the logs to Elmdownhole via email.
19:00	Drain and winterize the pump and lines, Secure and night cap the well head, Check bubble tester for bubbles, no bubbles, Fuel equipment.
19:30	Debrief with crew about the day and having a later start for morning 9:00am.

Time	Well Abandonments
07:00	Hold a pre job safety meeting and hazard assessment meeting. The topics discussed were new crew new to the rig and work area, conducted a site specific orientation and went over some of the procedures related to the project, expect a visit from Orog for an inspection. Discussed job scope for the day. The whole crew did the Elm orientation on complyworks before leaving the dog house.
08:00	Preform a walk around lease and equipment inspection, Crew is familiarizing themselves with the equipment, before opening the well. SICP 0 kPa. Check for ice plugs, check the bubble tester for bubbles, no bubbles. Function test the crown saver, E-kills, 3 functions of the BOP's starting pressure 21,500kPa final after 3 functions 15,000kPa.
09:30	Make up the 177.8mm permanent drillable 10k bridge plug on HM setting tool. Run in the hole with plug on 73mm tbg.
11:30	Locate casing collars @ 1107.3 & 1120.3mKB, Spot and set the bridge plug @ 1125mKB , by filling the tbg with 3.8m ³ of clean fresh water. Pressure up to 16mPa to activate the setting tool. Pick up 10 daN over string weight and hold for a few minutes. Lower the tbg down and set string weight (9 daN) on the plug. Pump down the casing to pressure up to 7 mPa, Hold for 15 minutes. Held solid. Bleed the pressure off. Pick up tbg and pull 2daN over string, Rotate the tbg 6 turns to the right to release the setting tool from the bridge plug. Reverse circulate 4m ³ to remove the air bubble from the tbg.
13:00	OROGO reps arrived on lease to conduct an inspection of the equipment and check certs on all equipment.
14:30	Suck back on the casing. Rig in air hose to displace water down the tbg up the casing to make room for the cement slurry. Batch up 0.5m ³ of class G oilwell cement at 1900kg/m ³ , Pour into the tubing. Rig in the pump line to forward circulate 3m ³ of clean fresh water. Stop the pump and the cement is balanced on top of the bridge plug leaving cement top @ 1101.4mKB Pull 4 joints slowly. Reverse circulate 4m ³ of fresh water clean returns. Stop the pump Pull out of the hole and lay down 85 joints. Stand 60 jts Rig in wire line unit. Hold a pre job safety meeting and hazard assessment meeting. The topics discussed were arming the gun, Keeping out of the wellhead area while picking up the gun and running in the hole.
18:00	Arm the 86mm ERHSC carrier loaded with 25gr Good hole charges with 60° Phasing 17 shots per meter . RIH and log into position using the CBL dated Jan 17 to correlate the gun to perforate at 470mKB to 471mKB . POOH with gun, Confirm all shots fired. Rig out wireline unit.
18:15	
18:30	Rig in pump lines to attempt circulation. Pump down the casing @ 400L/min Pumped 3.5m ³ before seeing returns up the surface casing vent. Pumped @ 350L/min for 5 minutes. no losses to record. Pumped a total of 5m ³ fresh down the casing. Stop the pump. Suck back on lines and wellhead.
19:00	Drain and winterize the pump and lines, Secure and night cap the wellhead. Fuel equipment.
19:30	Debrief with the crew about the day.

Time	Well Abandonments
07:00	Hold a pre job safety meeting and hazard assessment meeting. The topics discussed were job scope for the day, Hazards associated, Hazard hunting rigging out and moving equipment in and out of the lease.
08:00	Preform a walk around lease and equipment inspection, Function test the crown saver, E-kills and BOP's. SICP on slight vac. Rig in the pump lines to pump down the casing and return up the surface vent, Pumped 8m ³ of clean fresh water, Did not lose any fluid during circulating operations, The returns also were a water based drilling mud looking substance. Circulated at 200L/min with no circ pressure. stop the pump.
09:30	Make up and RIH with 177.8mm cement retainer. Called to confirm the set depth with office. Casing collar at 465.35mKB. Pull retainer up to 460mKB. Set the retainer by picking up tbg 1m, rotate tubing to the right 13 rotations, Lower retainer back down to set depth at 460mKB. Pick up and pull 16daN over string weight to pack off the element. Hold for 5 minutes. Lower the tbg down and set string weight on the retainer, repeat once more. Rig in the pump line to fill and pressure test the casing to 7 mPa and hold for 15 minutes. Held solid. Pull retainer into neutral by pulling 2 daN over string. Tie in the pump line to pressure test the retainer to 7 mPa, Held solid. Bleed the pressure off.
11:30	Lay down remaining tubing out of the derrick. Wait on cementers.
14:00	Cementers called to tell us they have been held up on their current job and will be late to arrive to do our job. Postponed the job for tomorrow morning 09:00.
14:30	Sting in to the retainer, tie in the pump line to pump the 20m ³ of clean fresh water down the tbg up the surface casing vent. Monitor the returns and still did not lease any returns to the formation. Returns cleaned up but the water is still gray. Leave the retainer stung in for the night
17:00	Drain and winterize the pump and lines, Secure and night cap the wellhead. fuel equipment. Haul a 24.5m ³ load of waste to Secure in Rainbow lake

Time	Well Abandonments
07:00	Hold a pre job safety meeting and hazard assessment meeting. The topics discussed were cementing operations procedures and rigging out moving to next lease.
08:00	Preform a walk around lease and equipment inspection. SICP 0 kPa. Function test the Crown saver, E-kills and BOP's. Wait on cementers to arrive.
11:30	Cementers arrived, Had some trouble with the road in and chained up all the equipment.
12:00	Hold a pre job safety meeting with the cementers. the topics discussed were spacing, spotting equipment, rigging in pump lines, Job proceudures, reviewed the cementing program.
12:30	Set up the wellhead area to tie in the cementers. There was some issues with the C&A units electrical and was able to find and fix the issue.
14:00	Start the pump, pumped 300L to break circulation back to the rig tank Stop the pump. close the tubing valve. Pressure test to 21mPa for for 2 minutes, No leaks.
14:45	Batch up 1m³ of CRS pre-flush to treat annular losses and prevent cement fallback.
14:52	Switch over to clean water and pump 0.15m³, stop the pump.
15:00	Prehydrate the mix water with addtivies 0.8% CDFL, 2.0% CAL BWOC in 8m³ of water to make 9.8m³ of slurry Mix dry CGL1800 cement with mix water while pumping down the tubing at 300L/min. No pressure to record until the cement hit the perfs then we started seeing 0.5mPa. mixed and pumped 9.8m³ of 1800kg/m³ slurry. Monitored the rate of return and confirmed 95% returns while circulating cement .
16:30	Prehydrate the mix water with addtivies 0.8% CDFL, 2.0% CAL BWOC in 3m³ of water to make 4m³ of slurry Mix dry CGL1800 cement with mix water while pumping down the tubing at 300L/min. No pressure to record until the cement hit the perfs then we started seeing 0.5mPa. mixed and pumped 4m³ of 1800kg/m³ slurry. Monitored the rate of return and confirmed and still 95% returns while circulating Ran out of cement before seeing cement returns to surface. With 1.4m³ of cement in the tubing, Close the surface casing vent. Pumped 300L to pressure up to 2 mPa. Stop the pump.
17:00	Wash up the pumping equipment while hesitating the squeeze.
17:40	pressure down to 0.3mPa. Restart the pump at 40L/min pumped 250L pressure at 2mPa stop the pump.
17:46	pressure down to 1.3mPa. Restart the pump at 40L/min pumped 150L pressure at 2mPa stop the pump.
17:56	pressure down to 1.3mPa. Restart the pump at 40L/min pumped 50L pressure at 2mPa stop the pump. Flat line for 10 minutes. at 2mPa.
18:28	Pull retainer into Neutral Bleed the pressure off. Sting out of the retainer. Pump 700L of fresh to balance the cement on the retainer. Pull 3 joints. rig in pump lines to
18:38	backwash with 2.2m³ of clean fresh water. Pull 5 more joints. 0.4m³ cement above the retainer, 0.3m³ below the retainer, 13m³ cement circulated around into the surface casing. 2.1mPa flat line for 10 minutes recorded
20:30	Secure and night cap the wellhead. Drain and winterize the pump and lines. Fuel equipment Shut down for the night. Debrief with crew.

10:00	Spotted equipment on site. Held pre job safety meeting with Innovative cut and ca crew and Sierra vac driver. Reviewed ELM ERP and safe work permit. Stars site number 4319. Discussed daily operations and hazards. Working on ice roads be sure all equipment is chained up all moving equipment must have spotters. Make sure we have 2 guys when lifting cutting tool out of hole.
10:30	Sweep location for LELEs installed bubble tester into surface vent monitored vent for 10 minutes no bubbles on vent. Confirmed J-37 coordinates 60.110,-117.608
11:00	Proceed to cutting wellhead installed tool into wellhead tied in hoses. Daylighted around wellhead exposed 16 inch conductor barrel. Set jet pressure made one full rotation with cutter.
12:00	Pulled up and removed wellhead and conductor barrel. Measured and confirmed well was cut 2.1 meters below existing ground level. Installed vented cap into casing. With well LSD and license number on it. Back filled hole with material on location. Hydro vc a hole 1 meter north of well installed lease sign cemented sign post 1 meter in the ground. Loaded all old wellhead components. Picked up all line locating sticks.
